Product Description

Product Description

To protect these very sensitive power semiconductor components from over-current faults, an extremely fast and low energy let-through circuit protection device is required. High-speed fuses are thermal current control devices used for semiconductor circuit protection. They have a structure specially designed for the electrical characteristics of semiconductor components and provide all the necessary short-circuit characteristics required to protect semiconductor devices, such as low energy let-through (I^2t), low peak current (IPEAK), low arc voltage and high heat dissipation.

In addition to the above protection capabilities, Golden's new generation of semiconductor fuses also have a variety of world-wide installation methods, compatible design in line with national electrical standards, and extremely fast response actions. Golden provides optimal circuit protection for power semiconductor applications with universal blade mounting and visual indicators.
